## 4-ALKENYL ( AND ALKYNYL ) OXINDOLES AS INHIBITORS OF CYCLIN-DEPENDENT KINASES, IN PARTICULAR CDK2

5           Uncontrolled cell proliferation is the hallmark of cancer. Cancerous tumor cells typically have some form of damage to the genes that directly or indirectly regulate the cell-division cycle.

Cyclin-dependent kinases (CDKs) are enzymes which are critical to cell  
10   cycle control. See, e.g., Coleman et al., "Chemical Inhibitors of Cyclin-dependent Kinases," *Annual Reports in Medicinal Chemistry*, vol. 32, 1997, pp. 171-179. These enzymes regulate the transitions between the different phases of the cell cycle, such as the progression from the G<sub>1</sub> phase to the S phase (the period of active DNA synthesis), or the progression from the G<sub>2</sub> phase to the M phase, in  
15   which active mitosis and cell-division occurs. See, e.g., the articles on this subject appearing in *Science*, vol. 274, 6 December 1996, pp 1643-1677.

CDKs are composed of a catalytic CDK subunit and a regulatory cyclin subunit. The cyclin subunit is the key regulator of CDK activity, with each CDK  
20   interacting with a specific subset of cyclins: e.g. cyclin A (CDK1, CDK 2). The different kinase/cyclin pairs regulate progression through specific stages of the cell cycle. See, e.g., Coleman, *supra*.

Aberrations in the cell cycle control system have been implicated in the  
25   uncontrolled growth of cancerous cells. See, e.g., Kamb, "Cell-Cycle Regulators and Cancer," *Trends in Genetics*, vol. 11, 1995, pp. 136-140; and Coleman, *supra*. In addition, changes in the expression of or in the genes encoding CDK's or their regulators have been observed in a number of tumors. See, e.g., Webster, "The Therapeutic Potential of Targeting the Cell Cycle," *Exp. Opin. Invest. Drugs*, Vol.  
30   7, pp. 865-887 (1998), and references cited therein. Thus, there is an extensive

body of literature validating the use of compounds inhibiting CDKs as anti-proliferative therapeutic agents. See, e.g. U.S. Patent No. 5,621,082 to Xiong et al; EP 0 666 270 A2; WO 97/16447; and the references cited in Coleman, *supra*, in particular reference no. 10. Thus, it is desirable to identify chemical inhibitors of  
5 CDK kinase activity.

It is particularly desirable to identify small molecule compounds that may be readily synthesized and are effective in inhibiting one or more CDKs or CDK/cyclin complexes, for treating one or more types of tumors.

10

Indolinone (also known as oxindole) compounds asserted to be useful in the regulating abnormal cell proliferation through tyrosine kinase inhibition are disclosed in WO 96/40116, WO 98/07695, WO 95/01349, WO 96/32380, WO 96/22976, WO 96/16964 (tyrosine kinase inhibitors), and WO 98/50356 (2-  
15 indolinone derivatives as modulators of protein kinase activity). Oxindole derivatives have also been described for various other therapeutic uses: 5,206,261 (improvement of cerebral function); WO 92/07830 (peptide antagonists); EP 580 502 A1 (antioxidants).

20

There continues to be a need for easily synthesized, small molecule compounds for the treatment of one or more types of tumors, in particular through regulation of CDKs. It is thus an object of this invention to provide such compounds and compositions containing such compounds.

### Compositions/Formulations

In an alternative embodiment, the present invention is directed to pharmaceutical compositions comprising at least one compound of formula I or formula II or a prodrug thereof, or a pharmaceutically acceptable salt of a  
5 compound of formula I or formula II or a prodrug of such compound.

These pharmaceutical compositions can be administered orally, for example, in the form of tablets, coated tablets, dragees, hard or soft gelatin capsules, solutions, emulsions or suspensions. They can also be administered  
10 rectally, for example, in the form of suppositories, or parenterally, for example, in the form of injection solutions.

The pharmaceutical compositions of the present invention comprising compounds of formula I or formula II, prodrugs of such compounds, or the salts  
15 thereof, may be manufactured in a manner that is known in the art, *e.g.* by means of conventional mixing, encapsulating, dissolving, granulating, emulsifying, entrapping, dragee-making, or lyophilizing processes. These pharmaceutical preparations can be formulated with therapeutically inert, inorganic or organic carriers. Lactose, corn starch or derivatives thereof, talc, steric acid or its salts  
20 can be used as such carriers for tablets, coated tablets, dragees and hard gelatin capsules. Suitable carriers for soft gelatin capsules include vegetable oils, waxes and fats. Depending on the nature of the active substance, no carriers are generally required in the case of soft gelatin capsules. Suitable carriers for the  
25 manufacture of solutions and syrups are water, polyols, saccharose, invert sugar and glucose. Suitable carriers for injection are water, alcohols, polyols, glycerine, vegetable oils, phospholipids and surfactants. Suitable carriers for suppositories are natural or hardened oils, waxes, fats and semi-liquid polyols.

The pharmaceutical preparations can also contain preserving agents,  
30 solubilizing agents, stabilizing agents, wetting agents, emulsifying agents, sweetening agents, coloring agents, flavoring agents, salts for varying the osmotic

pressure, buffers, coating agents or antioxidants. They can also contain other therapeutically valuable substances, including additional active ingredients other than those of formula I or II.

5        **Dosages**

As mentioned above, the compounds of the present invention are useful in the treatment or control of cell proliferative disorders, in particular oncological disorders. These compounds and formulations containing said compounds are particularly useful in the treatment or control of solid tumors, such as, for example,  
10    breast and colon tumors.

A therapeutically effective amount of a compound in accordance with this invention means an amount of compound that is effective to prevent, alleviate or ameliorate symptoms of disease or prolong the survival of the subject being  
15    treated. Determination of a therapeutically effective amount is within the skill in the art.

The therapeutically effective amount or dosage of a compound according to this invention can vary within wide limits and will be adjusted to the individual  
20    requirements in each particular case. In general, in the case of oral or parenteral administration to adult humans weighing approximately 70 Kg, a daily dosage of about 10 mg to about 10,000 mg, preferably from about 200 mg to about 1,000 mg, should be appropriate, although the upper limit may be exceeded when indicated. The daily dosage can be administered as a single dose or in divided  
25    doses, or for parenteral administration, it may be given as continuous infusion.

**Examples**

The compounds of the present invention may be synthesized according to known techniques, such as for example the general scheme provided above. The  
30    following examples illustrate preferred methods for synthesizing the compounds and formulations of the present invention.

After stirring for an additional 20 min, the reaction mixture was diluted with water (100 mL) and extracted with EtOAc (3X 100 mL). Combined EtOAc layers was dried (MgSO<sub>4</sub>) and concentrated to dryness under reduced pressure to give the desired product.

### CDK2 FlashPlate Assay

5

To determine inhibition of CDK2 activity, purified recombinant retinoblastoma (Rb) protein was coated on 96 well FlashPlates (New England Nuclear, Boston, MA). Rb is a natural substrate for phosphorylation by CDK2 (Herwig and Strauss *Eurr. J. Biochem.*, Vol. 246 (1997) pp. 581-601 and  
10 references therein). Recombinant active human Cyclin E/CDK2 complexes were partially purified from extracts of insect cells. The active Cyclin E/CDK2 was added to the Rb-coated FlashPlates along with <sup>33</sup>P-ATP and dilutions of test compounds. Plates were incubated for 25 minutes at room temperature with shaking, then washed and counted in the Topcount scintillation counter (Packard  
15 Instrument Co., Downers Grove, IL). Dilutions of test compounds were tested in duplicate in each assay. The percent inhibition of Rb phosphorylation, which is a measure of the inhibition of CDK2 activity, was determined according to the following formula:

$$20 \quad 100 \times \left[ \frac{\text{total} - \text{nonspecific}}{\text{total} - \text{nonspecific s}} \right]$$

where "test compound" refers to the average counts per minute of the test  
duplicates, "nonspecific" refers to the average counts per minute when no Cyclin  
E/CDK2 was added, and "total" refers to the average counts per minute when no  
25 compound was added.

The results of the foregoing *in vitro* experiments are set forth in Tables I A

### Cell-Based Assays

5

The estrogen receptor negative epithelial breast carcinoma line (MDA-MB-435) was purchased from American Type Cell Culture Collection (ATCC; Rockville, MD) and was grown in the medium recommended by ATCC. For analysis of the effect of the test compounds on growth of these cells, the cells

were plated at 2000 cells per well in a 96-well tissue culture plate, and were incubated overnight at 37°C with 5% CO<sub>2</sub>. The next day, the test compounds were dissolved in 100% dimethyl sulfoxide (DMSO) to yield a 10 mM stock solution. Each compound was diluted with sterile medium to 1 mM in a sufficient  
5 quantity to yield a final concentration of 120 µM. The compounds were then serially diluted in medium with 1.2% DMSO. One-fourth final volume of the diluted compounds was transferred to 96 well plates. Test compounds were assayed in duplicate. DMSO was added to a row of "control cells" such that the final concentration of DMSO in each well was 0.3%. Wells to which no cells were  
10 added served as the "blank." Wells to which no inhibitor was added served as "no inhibitor control". The plates were returned to the incubator, and 5 days post addition of test compound, were analyzed as described below.

3-(4,5-Dimethylthiazole-2-yl)-2,5-diphenyl-2H-tetrazolium bromide  
15 (thiazolyl blue; MTT) was added to each well to yield a final concentration of 1 mg/mL. The plates were then incubated at 37°C for 3 hours. The plates were centrifuged at 1000 rpm for 5 minutes prior to aspiration of the MTT-containing medium. The MTT-containing medium was then removed and 100 µL 100% ethanol was added to each well to dissolve the resulting formazan metabolite. To  
20 ensure complete dissolution, plates were shaken for 15 minutes at room temperature. Absorbencies were read in a microtiter plate reader (Molecular Dynamics) at a wavelength of 570 nm with a 650 nm reference. Percent inhibition was calculated by subtracting the absorbance of the blank (no cell) wells from all wells, then subtracting the division of the average absorbance of each test  
25 duplicate by the average of the controls from 1.00. Inhibitory concentrations (IC<sub>50</sub>) were determined from the linear regression of a plot of the logarithm of the concentration versus the percent inhibition.

The colon carcinoma line SW480 also was obtained from the ATCC and  
30 was tested according to the same protocol provided above with the following

modification: cell line SW480 was plated at 1000 cells per well and analyzed at 4 days post addition of test compound.

The results of the foregoing *in vitro* tests are set forth below in Tables II and
